## Why Fiberglass Tornado Shelters?

Many of us have fond memories of family times in our grandparents' storm shelters that were built back in the early 1900's at the turn of the last century. As we revisit these concrete shelters we see signs of ageing: cracking, mildewing, leaking, etc. It may no longer provide the safety that it once did. In fact, it may now very well be a safety hazard. Old steel shelters suffer from corrosion and rust over the years.

With today's technology and materials fiberglass is the choice for the future. Fiberglass is the preferred material because it offers safety, affordability and longevity, as it is rot resistant, waterproof and can withstand the tests of time.

So, your family can seek protection in "THE REFUGE" for years to come. You can be assured that this shelter will stand the test of time. "THE REFUGE" will be around from the turn of this Century, in the early 2000's, through the next millennium and beyond, providing the same protection from tornado's and damaging winds as it did for you from the day it was installed. There are also three sizes to choose from to better fit your needs.
